**Name: UDAY KRISHNA N**

## **Nth Fibonacci**

Write a program to return the nth number in the fibonacci series. The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like –

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

**For example:**

Input	Result
1	
4	0
7	2
	8

**Program:**

```
a=int(input()) b=0 c=1
```

```
if(a==1):    print("0")
```

```
elif(a==2):    print("1")
```

```
else:        for i in range
```

```
(3,a+1):
```

```
            d=b+c
```

```
b=c          c=d
```

```
print(d)
```

	Input	Expected	Got	
✓	1	0	0	✓
✓	4	2	2	✓
✓	7	8	8	✓

---

**Factors of a number**

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number).

**For example:**

Input	Result	
20	1 2 4 5 10	
	20	

### Program:

```
a=int(input())
for i in range(1,a+1):
    if(a%i==0):
        print(i,end=" ")
```

	Input	Expected	Got	
✓	20	1 2 4 5 10 20	1 2 4 5 10 20	✓
✓	5	1 5	1 5	✓
✓	13	1 13	1 13	✓

## Product of single digit

Given a positive integer N, check whether it can be represented as a product of single digit numbers.

Input Format:

Single Integer input.

Output Format:

Output displays Yes if condition satisfies else prints No.

Example Input:

14

Output:

Yes

Example Input:

13

Output:

No **Program:** a=int(input())

c=0 for i in range(1,10):

for j in range(1,10):

if i\*j==a: c=1

if(c==1):

print("Yes")

▼ else:

print("No")

	Input	Expected	Got	
✓	14	Yes	Yes	✓
✓	13	No	No	✓

---

### **Unique Digit Count**

Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ .

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'. **For example:**

Input	Result
292	2
1015	3

### Program:

```
a=input()
b=len(set(a)) print(b)
```

	Input	Expected	Got	
✓	292	2	2	✓
✓	1015	3	3	✓
✓	123	3	3	✓

Ex. No. : 4.5

## Non Repeated Digit Count

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ . Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 nonrepeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 nonrepeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 nonrepeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO nonrepeated digits in this number.

**For example:**

Input	Result
292	1
1015	2
108	3
22	0

**Program:** a={}

for i in input: if i in a:a[i]+=1

else:a[i]=1 print(sum([1 for i in a if  
a[i]==1]))

	Input	Expected	Got	
✓	292	1	1	✓
✓	1015	2	2	✓
✓	108	3	3	✓
✓	22	0	0	✓

**Name: UDAY KRISHNA N**

### **Next Perfect Square**

Given a number N, find the next perfect square greater than N.

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N.

Example Input:

10

Output:

16

**Program:**

```
import math
a=int(input())
b = a + 1 while
b > 0 :
    m=math.sqrt(b)
if(m==int(m)):
    print(b)
break else:
    b = b + 1
```

	Input	Expected	Got	
✓	10	16	16	✓

**Ex. No. : 4.7****Date: 13.04.24****Register No.: 231901057****Name: UDAY KRISHNA N**

---

### Sum of Series

Write a program to find the sum of the series  $1 + 11 + 111 + 1111 + \dots + n$  terms (n will be given as input from the user and sum will be the output)

Sample Test Cases

Test Case 1

Input

4

Output

1234

Explanation: as input is 4, have to take 4 terms.

$1 + 11 + 111 + 1111$

Test Case 2

Input

6

Output

123456

**For example:**

Input	Result
3	123

**Program:**

```
a=int(input()) t=1
```

```
s=0 for i in
```

```
range(a) s+=t
```

```
t=t*10+1
```

```
print(s)
```

	Input	Expected	Got	
✓	4	1234	1234	✓
✓	6	123456	123456	✓

## Prime Checking

Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption:  $2 \leq N \leq 5000$ , where N is the given number.

Example1: if the given number N is 7, the method must return 2

Example2: if the given number N is 10, the method must return 1

**For example:**

Input	Result
7	2
10	1

**Program:**

```
a=int(input()) c=0 for
```

```
i in range(2,a):
```

```
if(a%i==0): c=1
```

```
if(c==1): print("1")
```

```
elif(c==0): print("2")
```

	Input	Expected	Got	
✓	7	2	2	✓
✓	10	1	1	✓

## **Disarium Number**

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

**Input Format:**

Single Integer Input from stdin.

**Output Format:**

Yes or No.

**Example Input:**

175

**Output:**

Yes

Explanation  $1^1 +$

$7^2 + 5^3 = 175$

**Example Input:**

123

**Output:**

No

**For example:**

Inp ut	Res ult
175	Yes
123	No

**Program:**

```
a=input() n=len(a) r=0 for
```

```
i,d in enumerate(a):
```

```

r+=int(d)**(i+1)    if
r==int(a):

```

```

print("Yes")    else:

```

```

    print("No")

```

	Input	Expected	Got	
✓	175	Yes	Yes	✓
✓	123	No	No	✓

**Date: 13.04.24**

**Register No.: 231901057**

**Name: UDAY KRISHNA N**

## **Perfect Square After adding One**

Given an integer N, check whether N the given number can be made a perfect square after adding 1 to it.

Input Format:

Single integer input.

Output Format:

Yes or No.

Example Input:

24

Output:

Yes

Example Input:

26

Output:

No

**For example:**

Input	Result

24	Yes
----	-----

### Program:

```
import math
a=int(input()) b=a+1
c=math.sqrt(b)
if(c==int(c)):
print("Yes") else:
print("No")
```

	Input	Expected	Got	
✓	24	Yes	Yes	✓
✓	26	No	No	✓
